## Flea service information

**Remember!! People and pets must stay off carpets until they are completely dry!** It is also a good idea to open the windows and doors for awhile, even though you probably don't smell anything.

You will see a reduction in the number of fleas in a day or two, but it takes about **THREE TO FOUR WEEKS** for the materials we used to be completely effective. The insecticide we used will kill the adult fleas after they exit from the pupa (cocoon) stage. While in this pupa stage, they can't be killed with insecticides. Frequent vacuuming (every day if possible) with a vacuum with a rotating brush will help tremendously.

If an occasional flea comes in after a few weeks the insect growth regulator (IGR) will prevent any of their eggs from becoming adult fleas. This lasts for more than 90 days and completely breaks the flea life cycle. That is how we are able to give a conditional guarantee for 3 months.

You should take your pet to your veterinary clinic and get the pet started on one of the new oral or topical flea treatments. They are easy and very effective. This is the only way to have long term flea control.

It is our goal to provide the best pest control service available anywhere. This was our goal in 1976 when we started the business and it is still true today. If you are pleased with the service tell your friends and relatives.
